

PROJECT JOJO

Performance Nutrition & 6-Month Weightlifting Plan

PRESENTED BY

Alisson Gustavo • Allyson George • Christopher Lindoso • Hericc Rocha • José Mário

Subject Profile & Objectives

Athlete Profile

Name: Joe Joestar

Age: 25 years old

Discipline: Weightlifting / Strength Training

Medical Condition: Diabetes

Goal: Preparing for a competitive weightlifting event in 6 months.

Core Objectives

Nutritional Alignment: Optimize macro & micro-nutrient distribution for strength gains and post-exercise recovery.

Glycemic Control: Manage blood glucose levels effectively through tailored dietary choices and activity timing.

Periodization: Execute a structured 6-month progressive strength building program.

Protein & Whole Food Foundations

Prioritize Quality Protein

The foundation of the nutrition strategy centers on real, nutrient-dense whole foods while reducing processed options.

Target Intake: 1.2 to 1.6 g/kg of body weight per day, adapted to training intensity.

Essential Sources:

- Eggs, Chicken, Lean Beef, and Fish
- Beans, Lentils, Legumes, Soy, Nuts, and Seeds

Distribution: Include a high-quality protein source in every main meal to support muscle protein synthesis.

Meal Organization Strategy

Breakfast

Scrambled eggs with spinach and tomatoes, 1 slice of whole-grain bread, plain Greek yogurt with strawberries. Water or unsweetened coffee.

Lunch & Dinner

Grilled chicken breast, salmon, or lean beef with a large vegetable salad, olive oil, roasted sweet potato, steamed broccoli, and avocado.

Pre-Workout Snack

Plain Greek yogurt paired with a small portion of nuts and 1 small banana consumed prior to training sessions for energetic support.

Hydration & Sodium Balance

<2,300
mg Daily Sodium Baseline

Hydration & Reductions

Active Compensation: Sodium intake is adjusted higher during intense lifting to replace sweat loss.

Primary Hydration: Pure water and unsweetened beverages are prioritized exclusively.

Foods to Eliminate: Significantly restrict soft drinks, energy drinks, sweets, highly processed snacks, and refined sugars.

Diabetes & Exercise Safety

Individual Adaptation

Medical Guidance: Dietary and training protocols must be adapted in consultation with healthcare professionals.

Carbohydrate Flexibility: Lower-carbohydrate adjustments may be considered depending on individual glucose response.

Performance Safety: Regular glycemic monitoring ensures optimal fueling without risking intra-workout hypoglycemia.

Integrated Plan Summary

Domain	Target Plan	Key Strategy
Protein	1.2 – 1.6 g/kg/day	Include lean sources in every meal
Micronutrients	3 Veg / 2 Fruit daily	Prioritize whole fruits over fruit juices
Carbohydrates	2 – 4 Grain servings	Focus on whole grains & fiber-rich sources
Hydration & Sodium	<2,300 mg sodium baseline	Adjust fluid & sodium for sweat loss
Training Structure	6-Month Periodization	Base building → Peak strength → Taper

THE END
